KEN CARYL LANDS TRAFFIC IMPACT STUDY

1.0 INTRODUCTION

This traffic impact study has been prepared by the Fox Tuttle Transportation Group for the Ken Caryl Lands residential project. The project proposes to build up to a total of 950 residential units on three separate parcels located along W. Ken Caryl Avenue just east of the C-470 interchange in unincorporated Jefferson County.

The purpose of this study is to assist in identifying potential traffic impacts within the study area with buildout of this project in the short and long-term scenarios. The traffic study addresses morning and evening peak hour intersection conditions in the study area without and with the project added traffic. The information contained in this study is anticipated to be used by Jefferson County in identifying any intersection or roadway deficiencies and potential improvements for both the near term and long-term future scenarios necessary to service project-added traffic volumes.

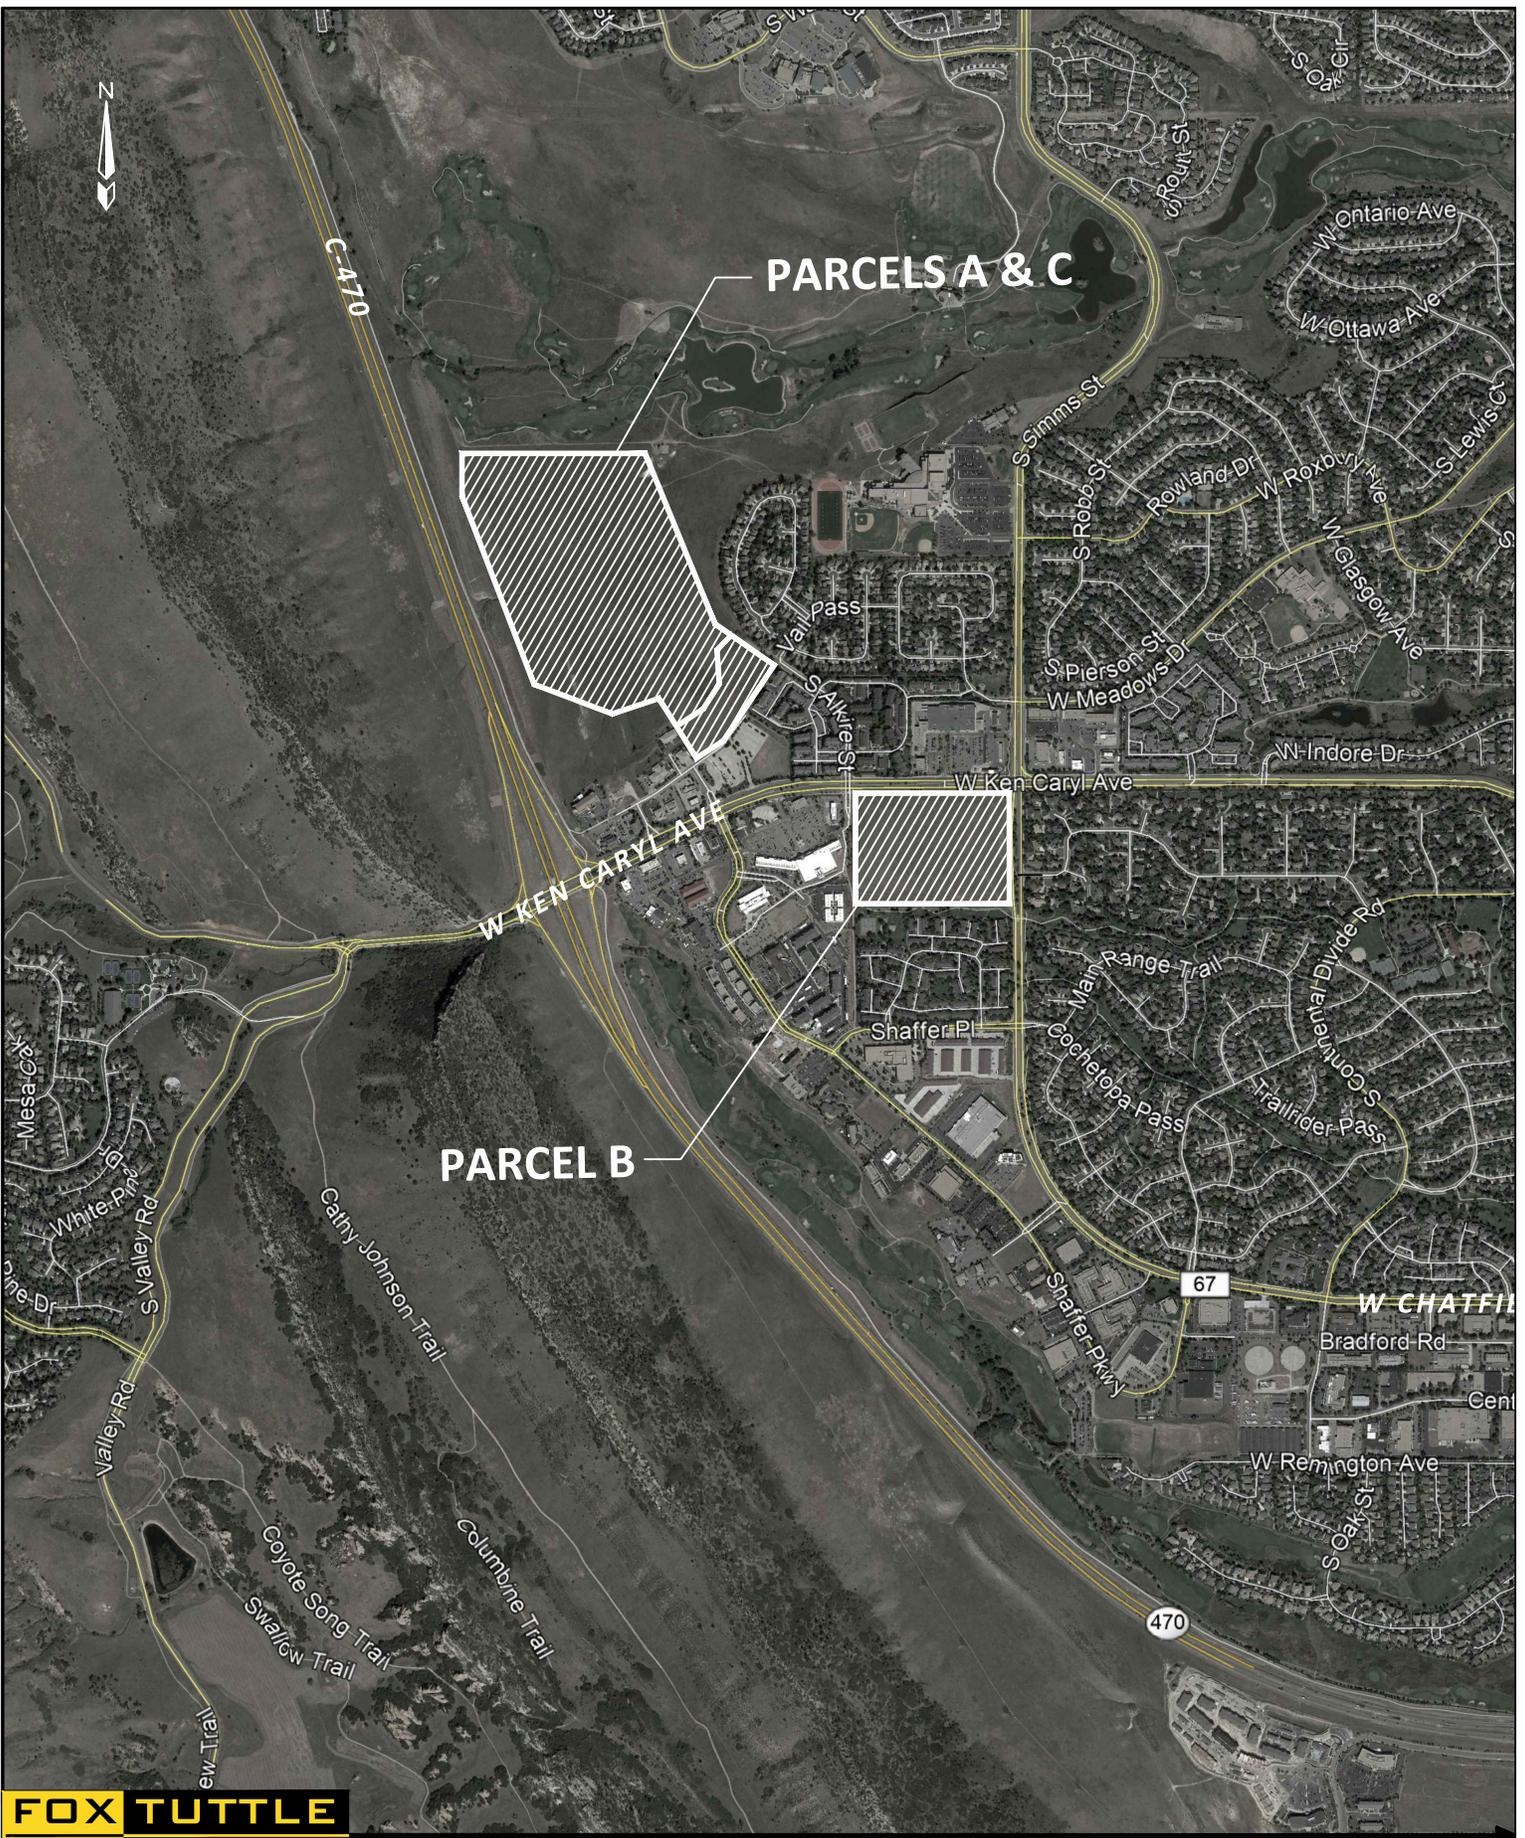

2.0 PROJECT DESCRIPTION

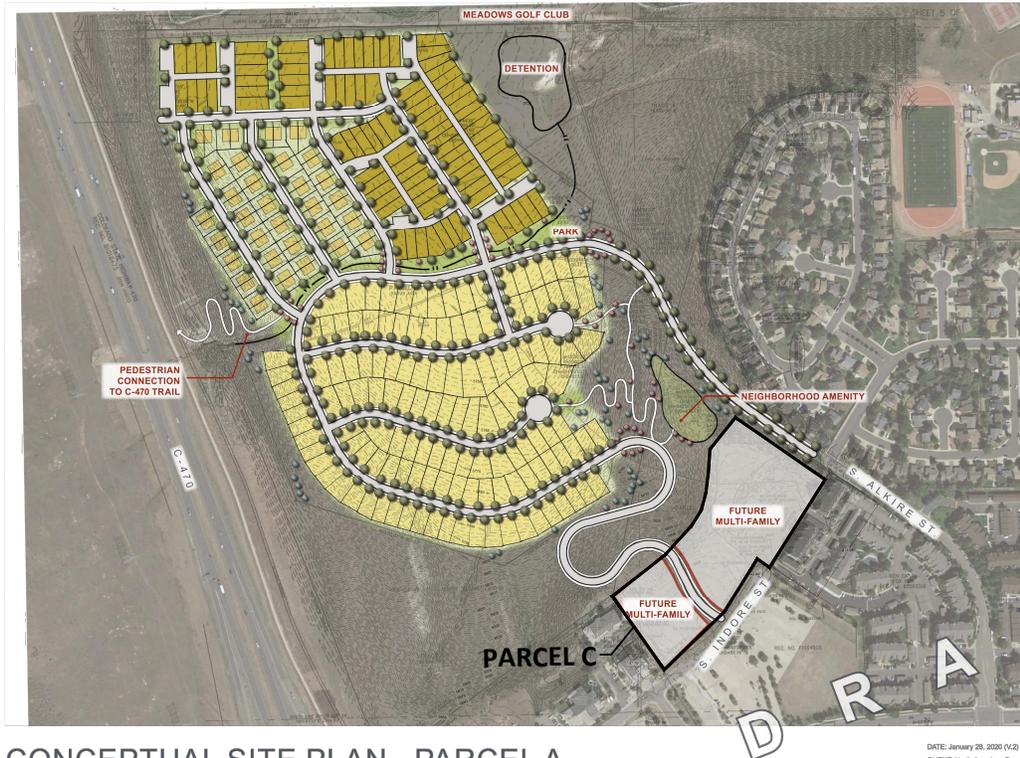

The Ken Caryl Lands project proposes to develop single-family detached, single-family paired homes, and multi-family dwelling units on three currently vacant parcels, as described below:

- Parcel A = ± 58.7 acres to be developed with up to 330 single-family residential units
- Parcel B = ± 27.7 acres to be developed with up to 270 multi-family residential units
- Parcel C = ± 11.9 acres to be developed with up to 350 multi-family residential units

A vicinity map is shown on **Figure 1**. Existing adjacent land uses include single-family and multi-family residential, retail, restaurant, and other commercial uses. Parcel C is located adjacent to the existing Regional Transportation District (RTD) Ken Caryl & C-470 Park-n-Ride.

The concept site plans illustrating proposed access are provided on **Figure 2**. Parcels A and C propose access from W. Ken Caryl Avenue via Shaffer Parkway/Indore Place and via an extension of S. Alkire Street into Parcel A. Access to Parcel B is proposed via a new south leg at the W. Ken Caryl Avenue & 12300 Block intersection and via a right-in, right-out access along W. Chatfield Avenue approximately 700' south of W. Ken Caryl Avenue.

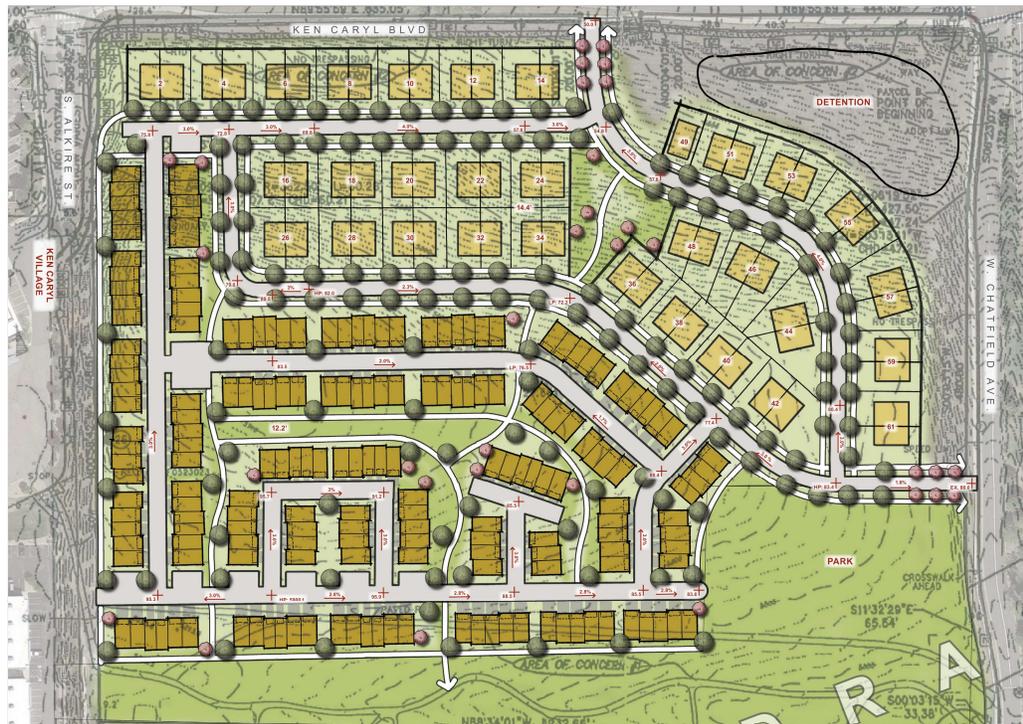

SITE TABULATION

■ SINGLE FAMILY DETACHED OF 2,500 SQ. FT.	136 UNITS
■ PAIRED HOMES OF 2,500 SQ. FT.	62 UNITS
■ ALLEY LOADED S.F.D. OF 2,100 SQ. FT.	95 UNITS
TOTAL UNITS	293 D.U.
MAX ALLOWED	330 D.U.
SITE AREA = 58.73 ACRES	
5 DWELLING UNITS PER ACRE	

CONCEPTUAL SITE PLAN - PARCEL A

3.0 EXISTING TRAFFIC CONDITIONS

3.1 Study Area and Circulation Network

The study area boundaries took into consideration the amount of traffic to be generated by the project and potential impact to the existing and proposed roadway network.

The existing study area street network consists of arterial, collector and local streets. The primary public roadways that serve the project site are discussed in the following text. Roadway classifications discussed are consistent with the Jefferson County Major Thoroughfare Plan¹. The existing study area roadway network is illustrated on **Figure 1**.

W. Ken Caryl Avenue is a six-lane roadway that is classified as a principal arterial between C-470 and W. Chatfield Avenue. East of W. Chatfield Avenue, there exist three westbound through lanes and two eastbound through lanes, with the roadway classified as a minor arterial. Per Colorado Department of Transportation (CDOT) data available on the Transportation Data Management System (TDMS), W. Ken Caryl Avenue is currently servicing approximately 19,800 vehicles per day (vpd) just east of C-470. The posted speed limit is 40 miles per hour (mph).

Per Section 3.4 of the Transportation Design and Construction Manual², a principal arterial street can carry over 25,000 vpd. On this basis, W. Ken Caryl Avenue is currently operating below its theoretical capacity for average daily traffic (ADT). There are no short or long-term improvement plans for W. Ken Caryl Avenue within the study area in the Jefferson County Capital Improvement Program (CIP) or most recent addendum (2014) to the Countywide Transportation Plan.

W. Chatfield Avenue is a four-lane roadway that is classified in the Thoroughfare Plan as a minor arterial roadway. Per CDOT data, W. Chatfield Avenue is currently servicing approximately 10,700 vpd just south of W. Ken Caryl Avenue adjacent to the proposed Parcel B access location. Per the Jefferson County criteria, W. Chatfield Avenue is operating within the 15,000-20,000 vpd theoretical capacity range for ADT. There are no short-term or long-term improvement plans for W. Chatfield Avenue within the study area in the Jefferson County CIP or Transportation Plan. The posted speed limit is 40 mph within the project vicinity. W. Chatfield Avenue becomes S. Simms Street as it continues to the north of W. Ken Caryl Avenue.

Shaffer Parkway is a two-to-four lane roadway (within the study area) that is classified in the Thoroughfare Plan as a major collector. Per Denver Regional Council of Governments (DRCOG) data, Shaffer Parkway is currently servicing approximately 10,000 vehicles per day (vpd) just south of W. Ken Caryl Avenue where it is a four-lane facility. Per the Jefferson County criteria, a major collector can carry 8,000 to 15,000 vpd. On this basis, Shaffer Avenue is currently operating within its theoretical capacity for ADT. There are no short-term or long-term improvement plans for Shaffer Parkway in the Jefferson County CIP or Transportation Plan. The posted speed limit is 30 mph within the project vicinity.

¹ Major Thoroughfare Plan. Jefferson County. Approved January 10, 2018.

² Transportation Design and Construction Manual. Jefferson County. Revised May 21, 2019.

S. Alkire Street is a two-lane roadway that is not specifically classified in the Thoroughfare Plan but is assumed to operate functionally as a collector roadway with a 44' flow-line width (wider than Jefferson County collector street cross-sections). Per DRCOG data, S. Alkire Street is currently servicing approximately 2,900 vpd just north of W. Ken Caryl Avenue. Per the Jefferson County criteria, a collector can carry 1,000 to 8,000. On this basis, S. Alkire Street is currently operating within its theoretical capacity for average daily traffic. There are no short-term or long-term improvement plans for Alkire Street within the study area in the Jefferson County CIP or Transportation Plan. The posted speed limit is 25 mph within the project vicinity

3.2 Existing Traffic Volumes

Weekday AM and PM peak period turning-movement were collected in February 2020 during typical conditions. The existing traffic volumes, including available CDOT TDMS daily traffic volumes (collected in 2019) are illustrated on **Figure 3**. The existing intersection geometry and traffic control are also shown on the traffic volume figure. Count data sheets are provided in the Appendix.

3.3 Existing Intersection Capacity Analysis

In determining the operational characteristics of an intersection, "Levels of Service" (LOS) A through F are applied, with LOS A indicating very good operations and LOS F indicating congested operations. The intersection LOS is represented as a delay in seconds per vehicle for the intersection as a whole and for each turning movement. A more detailed discussion of LOS methodology is contained in the Appendix for reference. Criteria contained in the Highway Capacity Manual (HCM)³ was applied for these analyses in order to determine existing levels of service and 95th-percentile queues during peak hour periods. Existing signal timing and phasing parameters were obtained from Jefferson County and incorporated into the Synchro models.

The results of the LOS and queue calculations for the intersections are summarized in **Table 1** for existing conditions. The intersection level of service and queue worksheets are attached in the Appendix. The data in the tables shows that all study intersections are operating acceptably overall and for individual movements (LOS D or better) in both peak hours, with the following exception:

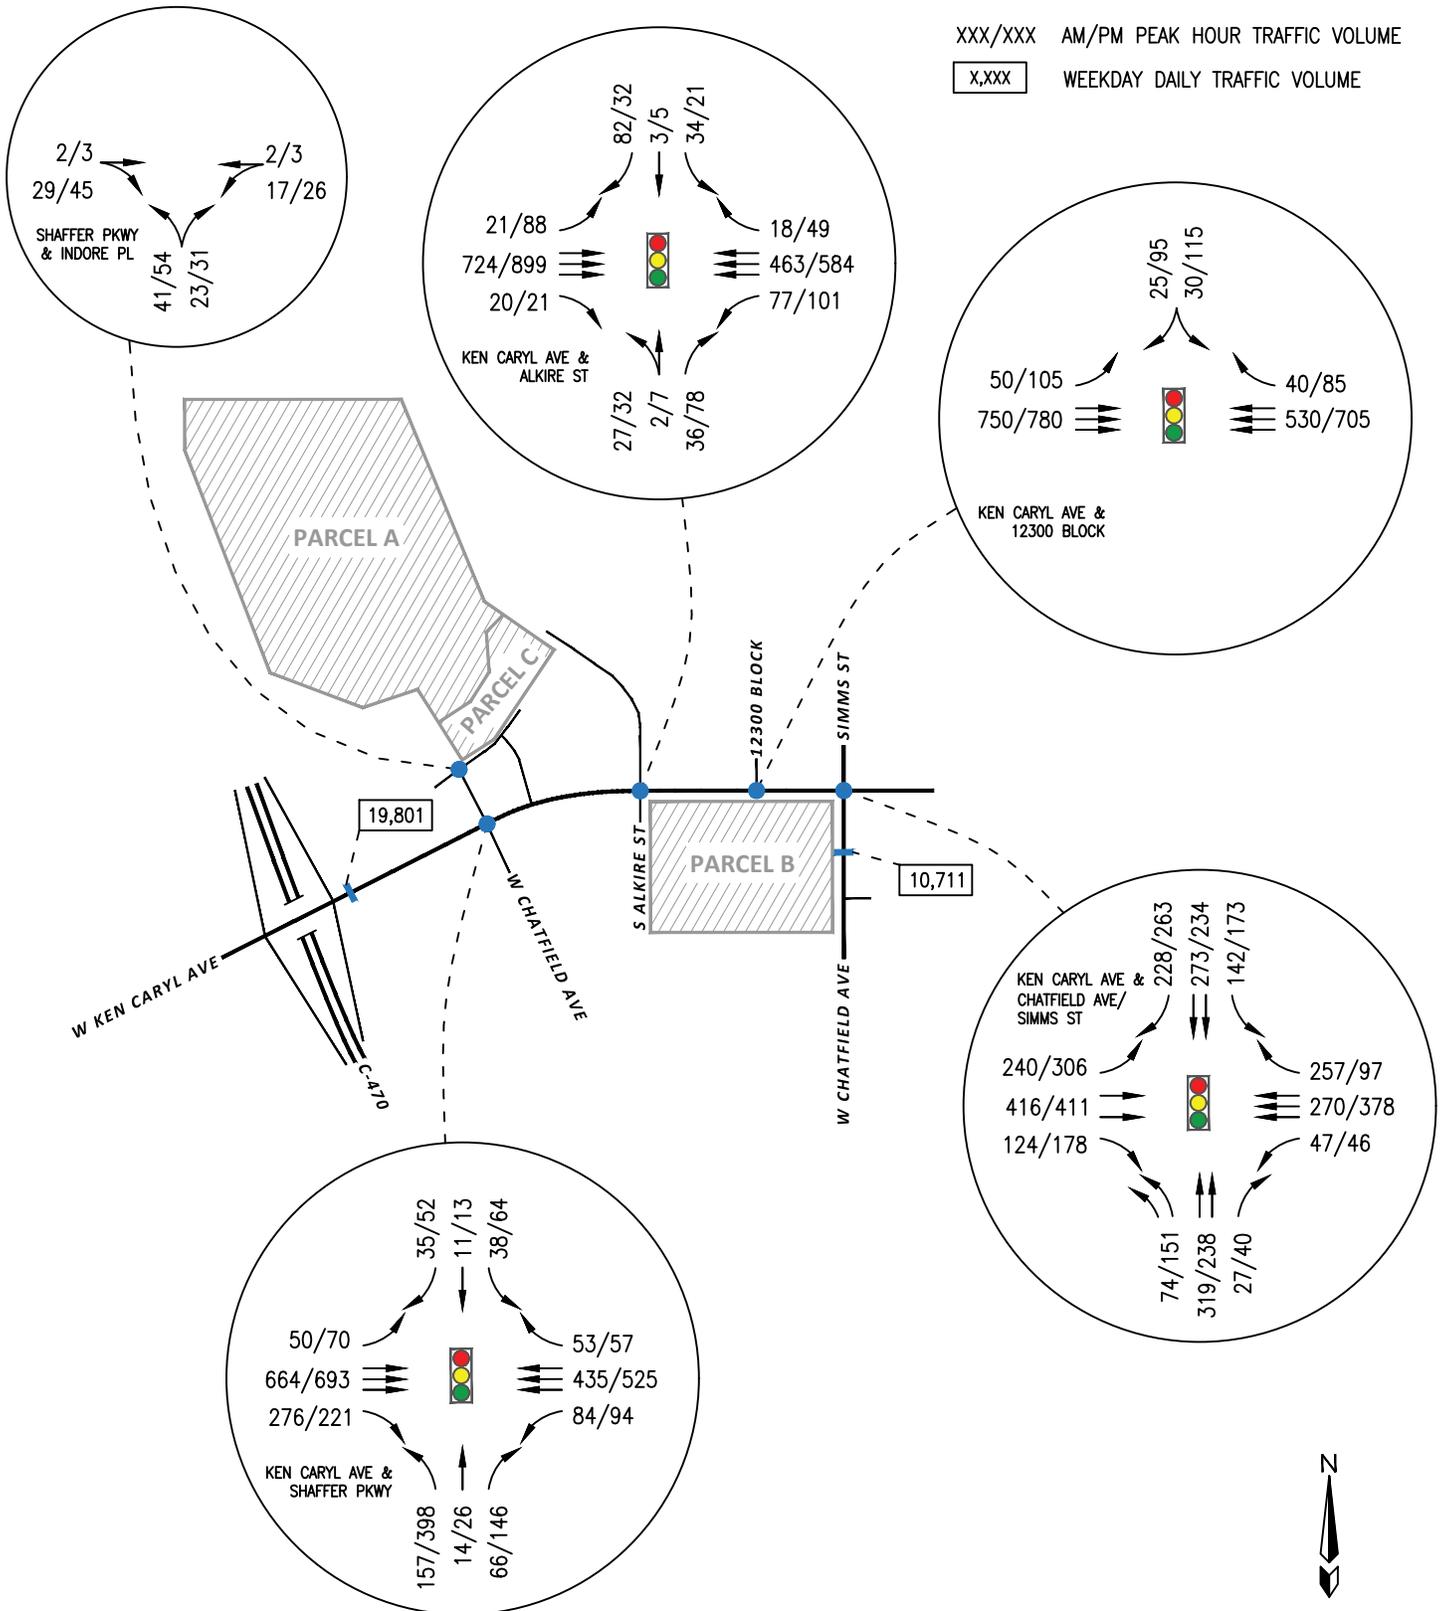

- W. Ken Caryl Avenue / W. Chatfield Avenue: The northbound and southbound left-turn movements are calculated to operate at LOS E in the PM peak hours. This is due to the protected-only left-turn phasing used to improve safety for the dual left-turn lane configuration. This level of service is typical for a protected-only left-turn at an arterial intersection and does not warrant mitigation.

³ Highway Capacity Manual, Sixth Edition, Transportation Research Board, National Research Council, 2016. Synchro v10 software utilized.

4.0 FUTURE TRAFFIC CONDITIONS WITHOUT PROJECT

4.1 Annual Growth Factor and Future Volume Methodology

Potential for background (non-project) traffic growth in the project vicinity was considered based on DRCOG regional travel model data and potential future development along the study area roadways. In general, with the exception of the project parcels, the area is largely built out, with some commercial development in-fill along Shaffer Parkway and W. Chatfield Avenue south of the project area. A comparison of the DRCOG base year and Year 2040 volume projections was performed to develop potential background growth on each study area roadway. Based on this data, a 1% annual background growth rate was applied within the study area, with lower growth assumed for W. Chatfield Avenue (0.5% annual) and S. Alkire Street (minimal growth as residential uses with direct access to S. Alkire Street are built out).

The project is anticipated to be fully built and occupied within the next 5 years. Thus, the Year 2025 planning horizon was assumed for the build-out or “opening day” scenario, with Year 2040 as the long-term planning scenario. Using the above growth rates, the projected Year 2025 background traffic volumes are provided on **Figure 4** with the projected Year 2040 background traffic volumes on **Figure 5**.

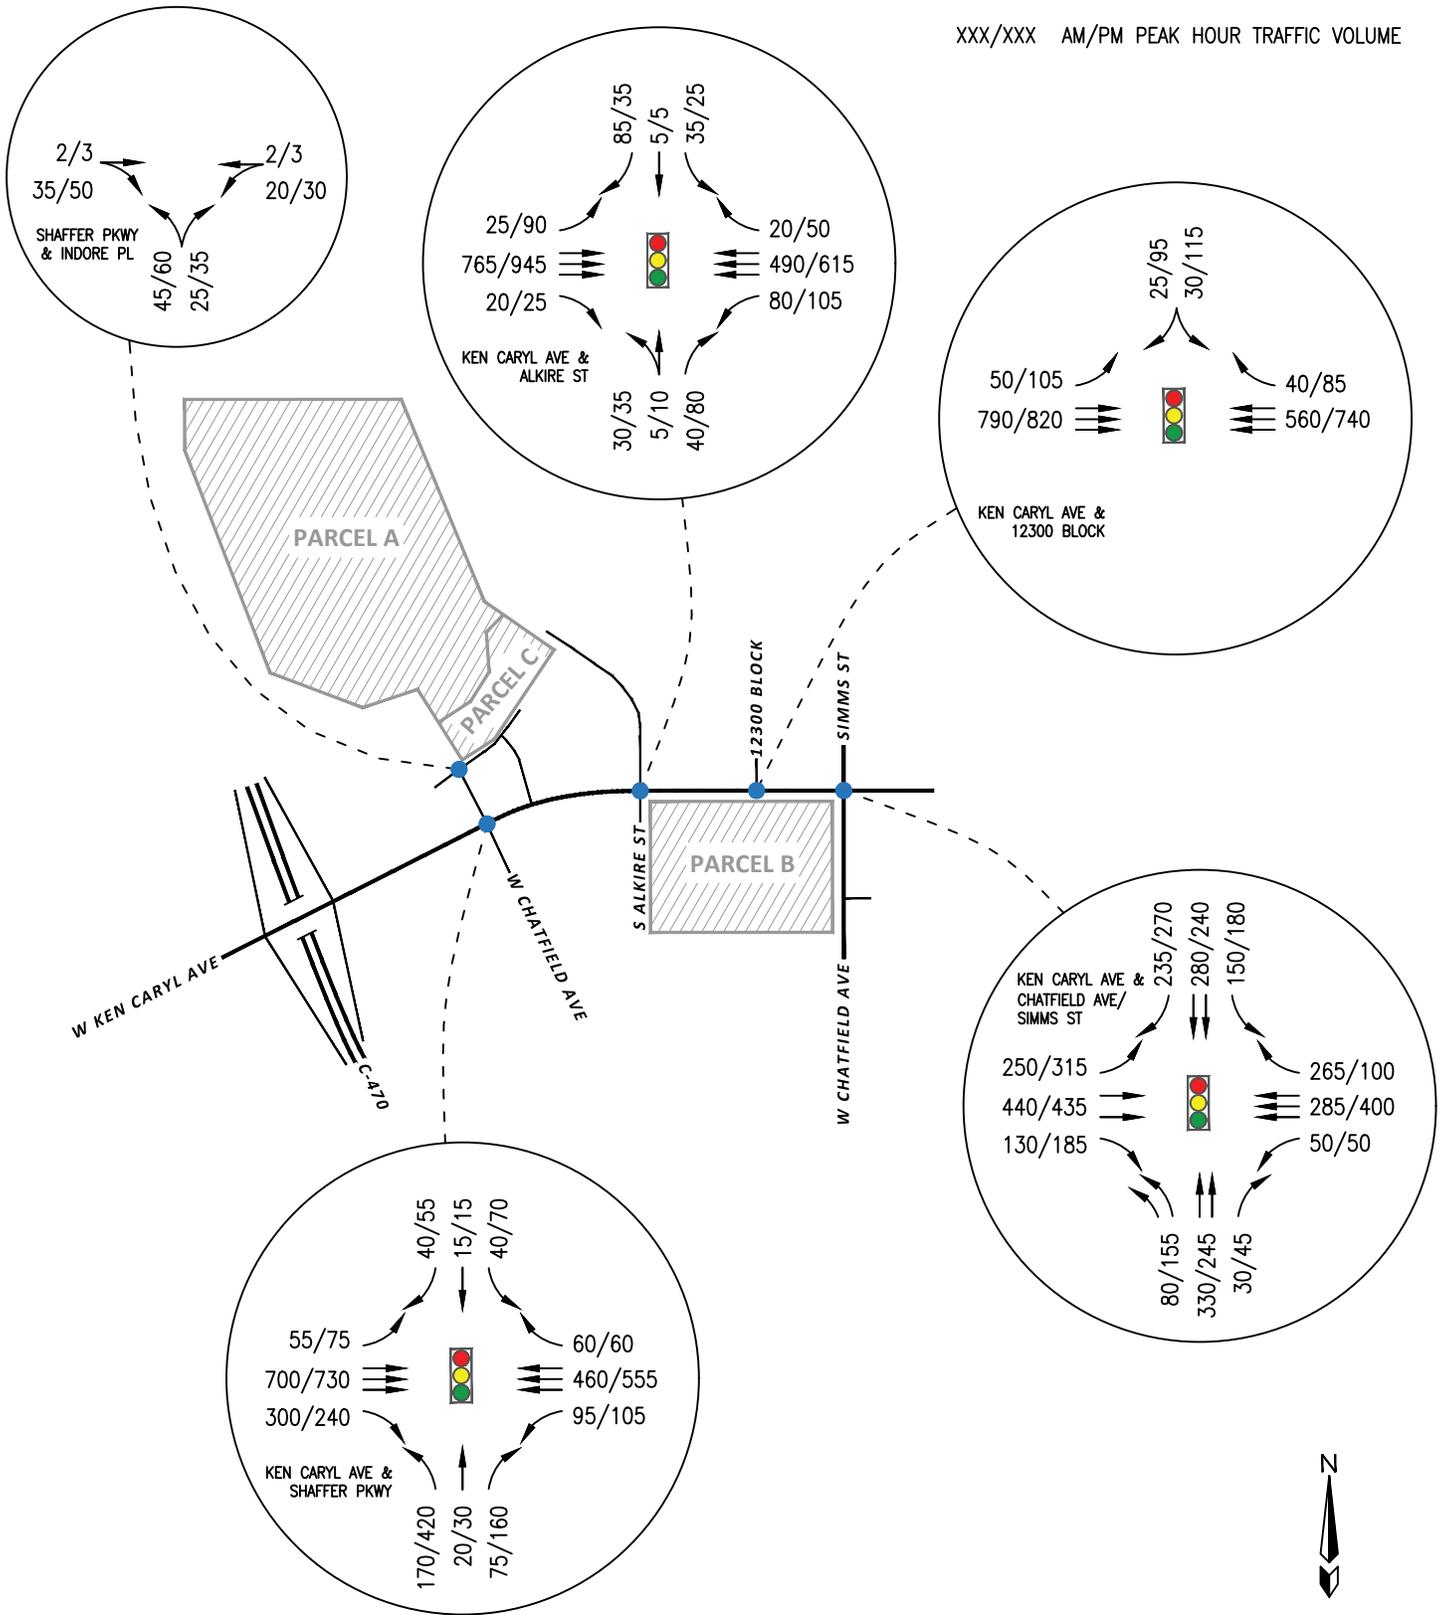

4.2 Future Year Background (without Project) Capacity Analysis

The level of service criteria discussed Section 3.3 was applied to the study area intersections to determine baseline operations for the Year 2025 and Year 2040 background traffic scenarios. The results of the LOS calculations are summarized on **Table 1** on the previous page. The intersection level of service and queue worksheets are attached in the Appendix.

The data on **Table 1** shows that all study intersections are projected to operate acceptably overall and for individual movements (LOS D or better) in both peak hours, with the exception of the northbound and southbound protected-only (dual) left-turn movements at the W. Ken Caryl Avenue & W. Chatfield Avenue intersection in the PM peak hour. As discussed previously, the protected-only operation is due to safety considerations for dual left-turns and the calculated LOS E does not warrant mitigation.

5.0 PROPOSED DEVELOPMENT TRAFFIC

5.1 Trip Generation

In order to estimate the anticipated volume of trips generated by the site at build-out of all three parcels, residential trip rates contained in the Institute of Transportation Engineers (ITE) Trip Generation manual⁴ for the appropriate land use categories were applied. The resulting existing trip estimates for each parcel are summarized on **Table 2** on the following page.

As shown, the 950 residential units on the three parcels combined are anticipated to generate a total of 6,673 daily, 492 AM peak hour and 630 PM peak hour trips at full build-out and occupancy. A 5% vehicular trip reduction was applied to the Parcel C multi-family trip estimates to account for adjacent mixed-use and proximity to the RTD Park-n-Ride facility which provides regional bus service via the 77, 100L and 116X routes.

5.2 Trip Distribution and Assignment

The estimated project build-out trips were distributed onto the surrounding roadway and intersection based on existing residential traffic patterns in the study area determined with the existing count data. Using this data, it is estimated that roughly 65% of the project traffic will be oriented to/from the west along W. Ken Caryl Avenue (including C-470) with 30% of the traffic along W. Ken Caryl Avenue towards W. Chatfield Avenue/S. Simms Street. Approximately 5% of the trips is assumed to be oriented towards local retail and commercial use in the project area. At W. Chatfield Avenue/S. Simms Street, 15% of the site trips area anticipated to be oriented to/from the east along W. Ken Caryl Avenue, 10% to/from the south along W. Chatfield Avenue, and 5% to/from the north along S. Simms St.

The anticipated project-added volumes at build-out, along with the trip distribution assumptions, is provided on **Figure 6**.

⁴ Trip Generation 10th Edition, Institute of Transportation Engineers, 2016.

KEY

XXX/XXX AM/PM PEAK HOUR TRAFFIC VOLUME

XX% PROJECT TRIP DISTRIBUTION

6.0 FUTURE TRAFFIC CONDITIONS WITH PROJECT

This analysis has been conducted in order to determine impacts associated with full development and occupancy of the project in the short-term (build-out) and long-term scenarios.

6.1 Intersection Capacity Analysis for Short-Term + Project Scenario

The site-generated traffic volumes were added to the Year 2025 background traffic volumes to analyze potential site impacts in the short-term, build-out scenario. The Year 2025 total traffic volumes are illustrated on **Figure 7**. The level of service criteria discussed in prior sections was applied to the study area intersections to determine impacts with the addition of project build-out traffic volumes in the short-term. The results of the LOS calculations for the intersections are summarized for each scenario in **Table 3**. The intersection level of service and queue worksheets are attached in the Appendix.

The data contained in **Table 3** illustrates that the study area intersections and proposed accesses will operate acceptably with the addition of project traffic at build-out in the short-term. Other than constructing the new access points as proposed, **no mitigation measures were identified as necessary to support project added traffic in the short-term planning horizon.**

6.2 Intersection Capacity Analysis for Long-Term + Project Scenario

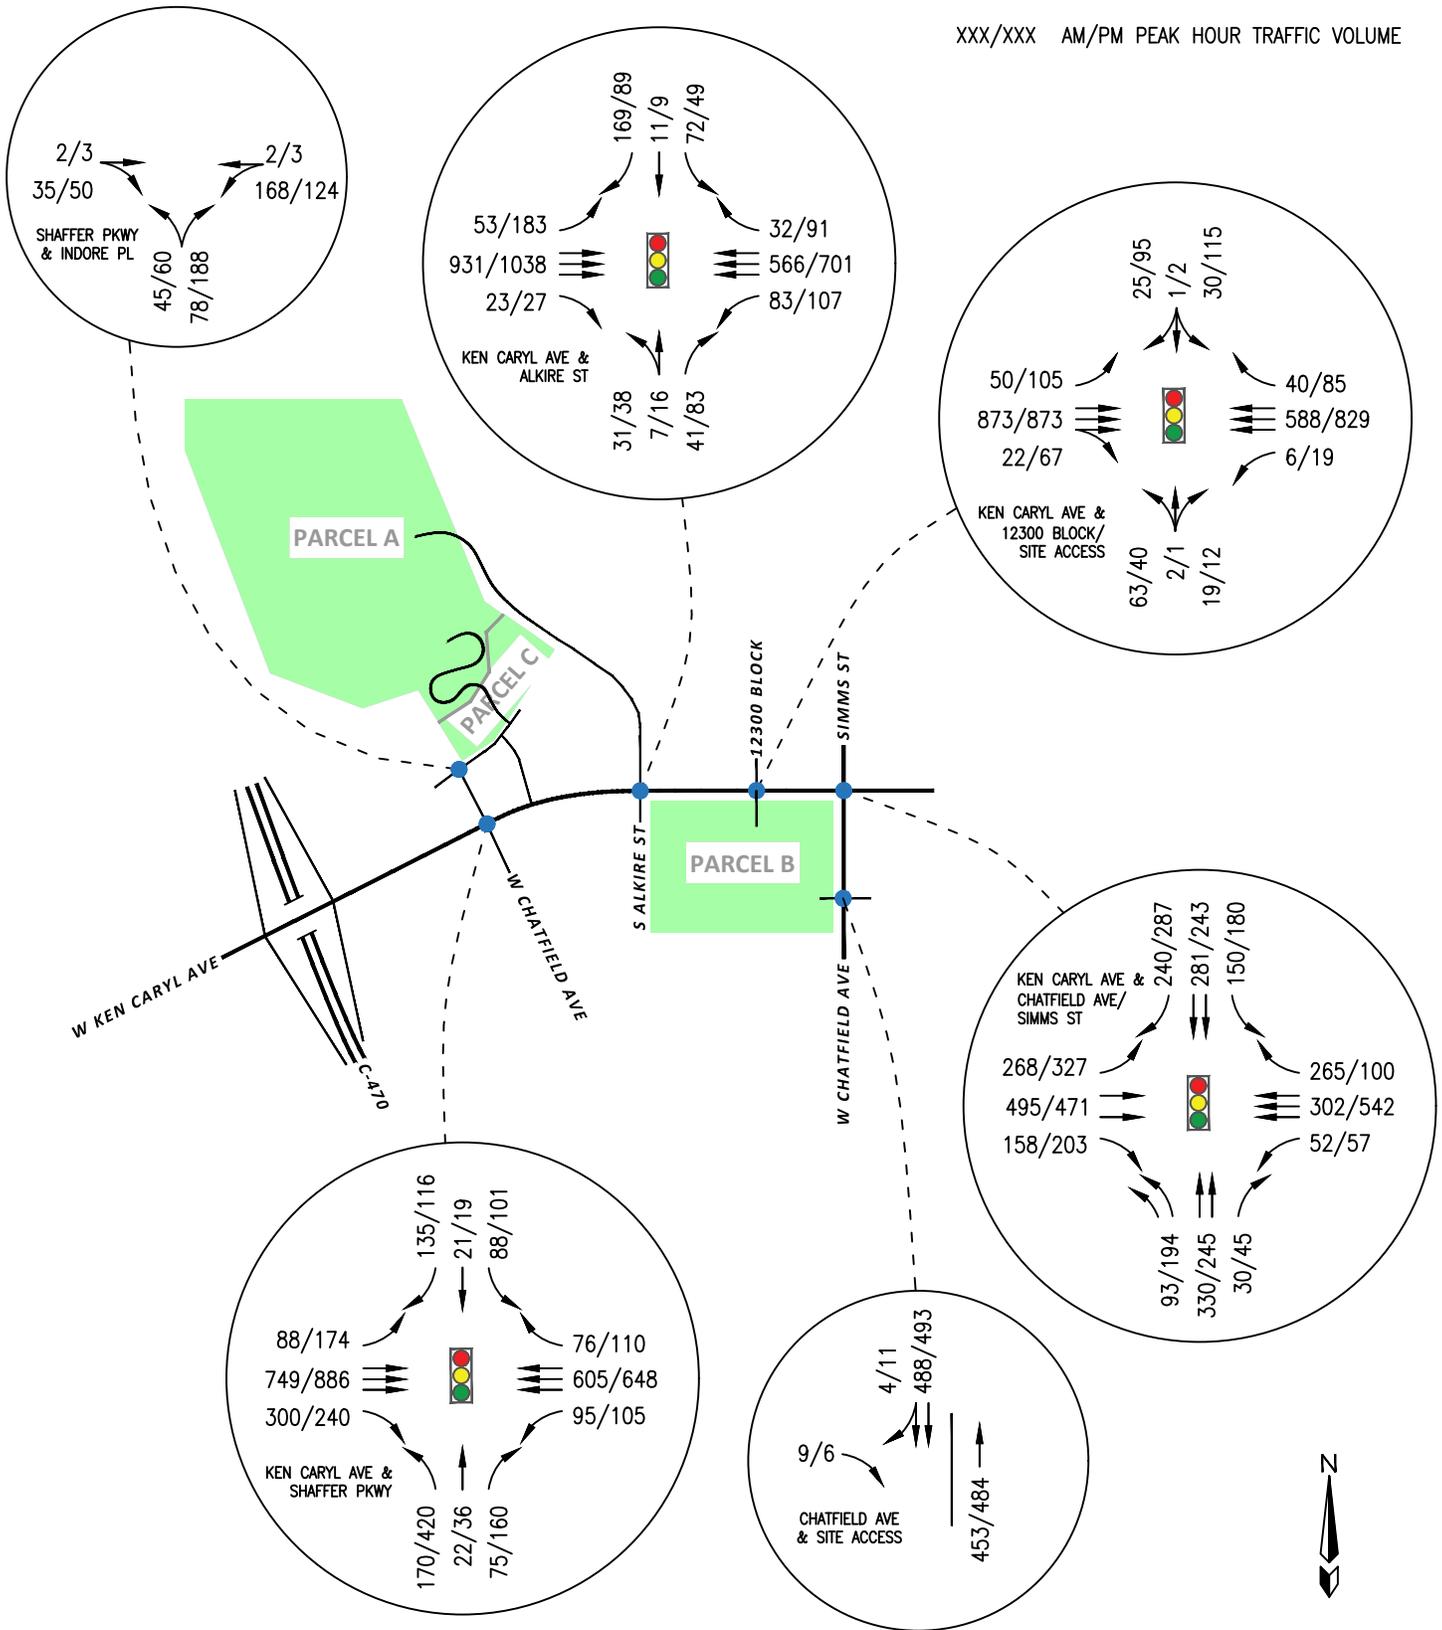

The site-generated traffic volumes were added to the Year 2040 background traffic volumes to analyze potential site impacts in the long-term, build-out scenario. The Year 2040 total traffic volumes are illustrated on **Figure 8**. The level of service criteria discussed in prior sections was applied to the study area intersections to determine impacts with the addition of project build-out traffic volumes in the long-term. The results of the LOS calculations for the intersections are summarized for each scenario in **Table 3**. The intersection level of service and queue worksheets are attached in the Appendix.

The data contained in **Table 3** illustrates that the study area intersections and proposed accesses will operate acceptably with the addition of project traffic at build-out in the long-term. Other than constructing the new access points as proposed, **no mitigation measures were identified as necessary to support project added traffic in the long-term planning horizon.**

As discussed previously, the northbound and southbound left-turn movements at the W. Ken Caryl Avenue & W. Chatfield Avenue intersection are calculated to operate at LOS E in the PM peak hours in all scenarios. This is due to the protected-only left-turn phasing used to improve safety for the dual left-turn lane configuration. This level of service is typical for a protected-only left-turn at an arterial intersection and does not warrant mitigation.

------	-------	----------------	-----	------	--------	----------	-----	----------	---

6.3 Site Access and Circulation

The project proposes the following access points and configurations:

- 1) (Parcel A and C) **Access via a new local street connection to Indore Place opposite the RTD Park-n-Ride.** This driveway should optimally align with the Park-n-Ride access to reduce turning movement path conflicts. This access will be controlled with a stop sign on the southbound (site access) approach.
- 2) (Parcel A) **Access via an extension of S. Alkire Street to the north into the site.** S. Alkire Street is currently closed north of Vail Pass, though a portion of the curb/gutter, sidewalk, and roadway was previously built but not maintained. It is anticipated that roughly 2/3rds of the Parcel A traffic will utilize this access, resulting in an increase in traffic of approximately 2,100 vpd on S. Alkire Street. As discussed previously, DRCOG shows approximately 2,900 vpd currently on S. Alkire Street just north of W. Ken Caryl Avenue and it anticipated that this volume drops off as S. Alkire Street continues north past existing multi-family uses. Per the Jefferson County criteria, a collector can carry 1,000 to 8,000 vpd, and thus S. Alkire Street is anticipated to continue to operate within its capacity with the addition of project traffic.
- 3) (Parcel B) **Access via a fourth (south) leg of the existing 12300 Block signalized intersection.** The south leg should be constructed by the project to align with the north leg of the intersection, with the signal improved to provide signal indications for all four legs in compliance with the Manual on Uniform Traffic Control Devices (MUTCD). A westbound left-turn lane should be constructed by the project to include a 100' deceleration lane with median modifications required to provide a back-to-back taper with the existing eastbound left-turn lane approaching W. Chatfield Avenue/S. Simms Street. Note that an eastbound right-turn deceleration lane is not necessary at this access. Using CDOT Access Code criteria, a right-turn lane is not necessary if there are three through lanes as exists on W. Ken Caryl Avenue, unless operational or safety conditions would dictate doing so. The projected volumes and future year operational analysis reinforce that an eastbound right-turn deceleration is not needed.
- 4) (Parcel B) **Access via W. Chatfield Avenue approximately 700' south of W. Ken Caryl Avenue.** This access will be restricted to right-in, right-out movements with the existing landscape median on W. Chatfield Avenue. A southbound right-turn deceleration lane on W. Chatfield Avenue is not warranted based on projected volumes. This access will be controlled with a stop sign on the eastbound (site access) approach.

The intersection of Shaffer Parkway with Indore Place is currently controlled with stop signs on the sidestreet (Indore Place) approaches, with flashing beacons to reinforce the stop condition when fire trucks are utilizing the West Metro Fire Rescue Station 13 access on the north leg of this intersection. There is also a beacon on the northbound approach to require vehicles to stop for fire trucks when flashing. Per **Table 3**, this intersection is anticipated to operate acceptably with LOS B or better on all approaches with the addition of project traffic with the existing stop

control. Per the queuing reports provided for each intersection/scenario in the Appendix, the westbound approach is projected to operate with a 95th-percentile queue of 31', or less than two vehicles during the busiest peak hour. This illustrates that the projected-added traffic will have minimal impact on RTD bus operations with the bus exit driveway located roughly 60' to the east of the westbound stop bar.

The southbound approach on Shaffer Parkway at the W. Ken Caryl Avenue intersection will experience an increase of traffic with the project-added volumes. The southbound approach is projected to continue to operate with an acceptable level of service with the existing lane geometry and signal timing. The longest 95th-percentile peak hour queues for the southbound approach are anticipated to increase from 59' (< three vehicles) (existing PM) to 76' (approx. 3 vehicles) (2040 total AM), indicating that the project-added traffic will not result in any future operational issues on this approach. Similarly, the project will increase the eastbound left-turn volume from W. Ken Caryl Avenue to northbound Shaffer Parkway. The average queue in the busiest peak hour (2040 total PM) is projected to be roughly 90' (3.6 vehicles) with the 95th-percentile queue projected at 137' (5.5 vehicles). The average queue will be contained within the 120' existing left-turn storage, with the 95th-percentile queue extending into the 180' taper area by roughly ½ vehicle. If any spillback of this lane into the adjacent eastbound through lane is observed in the future, this can be mitigated with minor timing adjustments to increase the protected portion of the protected-permissive left-turn phasing while maintaining adequate level of service for the opposing (westbound) through movement.

Pedestrian and bicycle traffic is anticipated to be accommodated via extensions of existing roadway and sidewalk facilities into the site and via internal connections to existing regional trail facilities. A pedestrian/bike connection to the C-470 trail is proposed at the west side of Parcel A. A pedestrian connection at the south boundary of Parcel B will connect to the off-street 8' asphalt trail, which provides access to the retail sites to the west and a mid-block rectangular rapid flash beacon (RRFB) crossing of W. Chatfield Avenue and multi-use paths to the east and south. The RTD Park-n-Ride located adjacent to Parcel C provides access to local and regional transit routes.

7.0 CONCLUSIONS

This traffic impact study has been prepared by the Fox Tuttle Transportation Group for the Ken Caryl Lands residential project. The project proposes to build up to a total of 950 residential units on three separate Parcels located along W. Ken Caryl Avenue just east of the C-470 interchange in unincorporated Jefferson County. Access is proposed via Indore Place (via Shaffer Parkway), an extension of S. Alkire Street, access via W. Ken Caryl Avenue, and via W. Chatfield Avenue. The purpose of this study is to assist in identifying potential traffic impacts within the study area with buildout of this project in the short and long-term scenarios. The traffic study addresses morning and evening peak hour intersection conditions in the study area without and with the project added traffic.

The project is anticipated to generate a total of approximately 6,673 daily, 492 AM peak hour and 630 PM peak hour trips at full build-out and occupancy. It was determined that the project-added traffic can be accommodated on the existing and future roadway and intersection network with minimal impacts.

The following improvements are recommended to be implemented by the project to service project-added traffic:

- Construct a fourth (south) leg of the 12300 Block & W. Ken Caryl Avenue intersection, to align with the existing north leg. Reconstruct the signal to include signal indications for all movements per the MUTCD, along with pedestrian accommodations to facilitate walking trips from Parcel B to retail on the north side of W. Ken Caryl Avenue. Reconstruct the median on the east leg to include a 100' westbound left-turn lane into the site and a back-to-back taper with the eastbound left-turn lane approaching W. Chatfield Avenue/S. Simms Street.
- Construct S. Alkire Street extension, Indore Place and W. Chatfield Avenue (restricted right-in, right-out) accesses as proposed.
- Construct bicycle and pedestrian connections to existing sidewalks and local/regional trails as proposed.

APPENDIX

Level of Service Definitions
Intersection Capacity Worksheets
Traffic Count Data Sheets

Level of Service Definitions

LEVEL OF SERVICE DEFINITIONS

In rating roadway and intersection operating conditions with existing or future traffic volumes, “Levels of Service” (LOS) A through F are used, with LOS A indicating very good operation and LOS F indicating poor operation. Levels of service at signalized and unsignalized intersections are closely associated with vehicle delays experienced in seconds per vehicle. More complete level of service definitions and delay data for signal and stop sign controlled intersections are contained in the following table for reference.

Level of Service Rating	Delay in seconds per vehicle (a)		Definition
	Signalized	Unsignalized	
A	0.0 to 10.0	0.0 to 10.0	Low vehicular traffic volumes; primarily free flow operations. Density is low and vehicles can freely maneuver within the traffic stream. Drivers are able to maintain their desired speeds with little or no delay.
B	10.1 to 20.0	10.1 to 15.0	Stable vehicular traffic volume flow with potential for some restriction of operating speeds due to traffic conditions. Vehicle maneuvering is only slightly restricted. The stopped delays are not bothersome and drivers are not subject to appreciable tension.
C	20.1 to 35.0	15.1 to 25.0	Stable traffic operations, however the ability for vehicles to maneuver is more restricted by the increase in traffic volumes. Relatively satisfactory operating speeds prevail, but adverse signal coordination or longer vehicle queues cause delays along the corridor.
D	35.1 to 55.0	25.1 to 35.0	Approaching unstable vehicular traffic flow where small increases in volume could cause substantial delays. Most drivers are restricted in ability to maneuver and selection of travel speeds due to congestion. Driver comfort and convenience are low, but tolerable.
E	55.1 to 80.0	35.1 to 50.0	Traffic operations characterized by significant approach delays and average travel speeds of one-half to one-third the free flow speed. Vehicular flow is unstable and there is potential for stoppages of brief duration. High signal density, extensive vehicle queuing, or corridor signal progression/timing are the typical causes of vehicle delays at signalized corridors.
F	> 80.0	> 50.0	Forced vehicular traffic flow and operations with high approach delays at critical intersections. Vehicle speeds are reduced substantially, and stoppages may occur for short or long periods of time because of downstream congestion.

(a) Delay ranges based on Highway Capacity Manual (6th Edition, 2016) criteria.

Intersection Summary

Cycle Length: 120
 Actuated Cycle Length: 120
 Offset: 61 (51%), Referenced to phase 2:EBTL and 6:WBTL, Start of Yellow
 Natural Cycle: 60
 Control Type: Actuated-Coordinated
 Maximum v/c Ratio: 0.81
 Intersection Signal Delay: 13.7
 Intersection LOS: B
 Intersection Capacity Utilization 52.7%
 ICU Level of Service A
 Analysis Period (min) 15

Splits and Phases: 4: Site Access/12300 Block & Ken Caryl Ave

Intersection Summary

95th percentile volume exceeds capacity, queue may be longer.

Queue shown is maximum after two cycles.

m Volume for 95th percentile queue is metered by upstream signal.
